

ActiveListener™

Image
Enabling Without
Programming

"Active Listener gives me the best of both worlds. I have one-key image retrieval from my Enterprise Accounting System ("EAS") as well as the ability to search and find documents independently of the EAS. This makes our A/P and Purchasing folks doubly productive. They can answer specific questions on specific documents quickly, yet still aggregate a range of documents for auditors and the IRS without being locked into the structure of the EAS".

Tom Hughes,
Senior Advisor for
Strategic Planning

The George Washington
University

WHAT IF IT WAS POSSIBLE ...

for someone to access a record in your data processing system, hit a function key and retrieve all documents associated with that record?

They could be in your ERP or CRM system... or they could be reading an email message, accessing a web page or viewing a list file. With ActiveListener from NMS Imaging, they can select any value on their computer screen and have immediate access to all associated documents.

What if you could image "or document" enable any software application without the expense, time and on-going maintenance of custom software programming? What if it could be deployed in five minutes?

ActiveListener™ from NMS Imaging enables any Windows™ application to be image enabled on-the-fly. Any application from Windows GUI programs, web browsers, terminal emulators, email messages or a computer -file such as a spreadsheet can be enabled with ActiveListener™. Cross reference a common field between your data processing and your document management system, and you are in business.

ActiveListener™

HOW IT WORKS

Active Listener is a software application that runs in the background on a desktop PC. With easy-to-use menus it can be configured to map an index field from your data processing system to your document imaging system. You can then configure a hotkey on the user keyboard to trigger on-demand retrieval of documents from within your host program. Then you are done. It's that simple.

With ActiveListener, users do not need to launch the document management program. They do not need to log into the DM program. And, they do not need to key enter the cross reference index from their data processing system. There is no need to execute a query or navigate through hit-lists. All of these activities are handled by ActiveListener. They just click and view.

WITH ACTIVE LISTENER...

Any user in a data processing system can access documents from their imaging system by pressing a function key.

Any value in the content of an email message or data file can be highlighted and trigger a document query to image enable terminal emulators, email, spreadsheets and list files, in addition to Windows programs.

Users can query the document management system and access information using Voice Recognition instructions for 508 Compliance for persons with disabilities.

Auto Logon to your document management systems enables uninterrupted lookups that take you right to the document (or hit-list of all documents), matching the record.

FEATURES:

Retrieve documents without leaving the desktop business system

Hot-Key document lookup

Drag & Drop document lookup

Voice Recognition Module

Auto Log-on to your document management system

Easily expandable to any document management system with expansion packs

Straight forward setup means no complex programming or scripting

Integration is done at the operating presentation layer in your data processing environment with zero toolkit level integration to the host program. This means that you can perform upgrades and enhancements to the host program without requiring upgrades to the document enabling application in Active Listener.
